

# Clinical Care and Coordination Program

UnitedHealthcare | March Vision Care's Clinical Care and Coordination Program is a comprehensive provider and member engagement program designed to influence the best outcomes for diabetic members. Diabetes is the leading cause of blindness among adults, ages 18-64.<sup>1</sup> With more than 11% of the US population living with diabetes and 38% of adults with prediabetes,<sup>1</sup> it is important for providers and members to understand the dangers of diabetes to our overall health and wellness, especially when it comes to vision.

## How can I help my patients with diabetes?

You have the opportunity to participate and become certified in our Clinical Care and Coordination Program and partner with us to help screen and monitor patients with diabetes and the potential for diabetic retinopathy. Once you're certified, patients will see a badge displayed by your name in our provider directory. The program also includes exam reminders for patients, notifications to primary care physicians (PCPs) and ongoing education opportunities.

### You will be eligible for certification once you meet our established clinical and quality program criteria. You must:

- Be an active provider with UnitedHealthcare Community Vision Network / March Vision Network for exams and materials
- Complete the required training courses
- Perform dilation/retinal imaging on diabetic patients during comprehensive exam
- Send notifications with exam outcomes for every diabetic member to their PCP
- Submit CPTII codes on vision claims to UnitedHealthcare Community Vision Network / March Vision Network

This badge will appear by your name in our provider directory to indicate you are certified in our Clinical Care and Coordination Program.
